

Project Status

CNM and Hard X-ray Nanoprobe Beamline

Jörg Maser

*Advanced Photon Source
Center for Nanoscale Materials
Argonne National Laboratory*

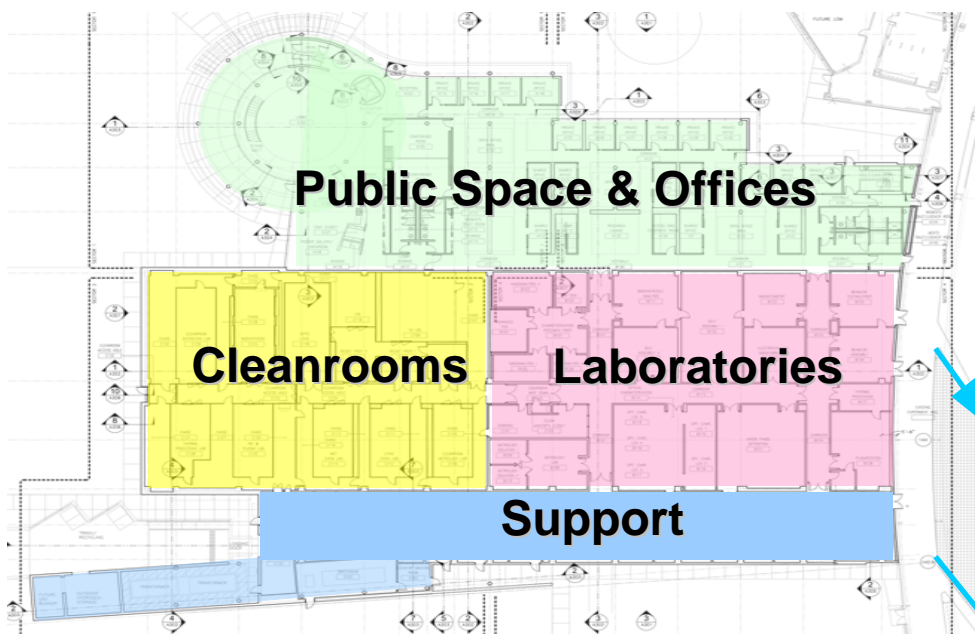

CNM/Nanoprobe beamline

Center for Nanoscale Materials

“Explore and develop new approaches to
Fabrication, characterization, understanding
of
Nanoscale confined materials with new
properties”

- \$36 M DOE equipment.
- \$36 M State-of-Illinois building.
- Building completed in FY06.
- \$18.5 M DOE Operations funds in FY07.

Nanoprobe Beamline APS Sector 26

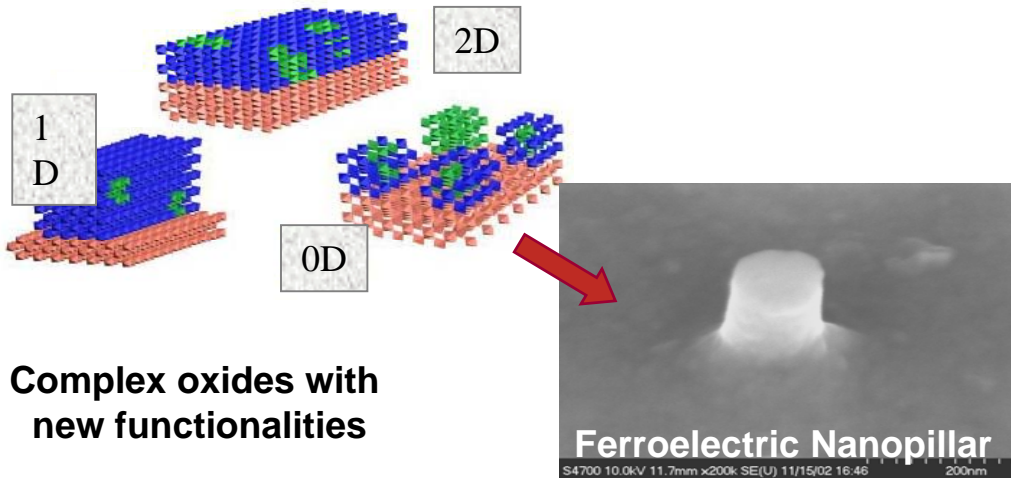

Operations Meeting; Oct. 27, 2004

CNM Scientific Themes

Novel functional nanocomposites

- Bio-Inorganic Interface (*D. Tiede, T. Rajh, M. Firestone*)
 - Nanocarbon (*D. Gruen, J. Carlisle*)
 - Nanomagnetism (*S. Bader, A. Hoffmann*)
 - Complex Oxides (*O. Auciello, S. Streiffer*)
 - Nanophotonics (*G. Wiederrecht, S. Gray*)
 - Virtual Fab Lab (*S. Gray, P. Zapol*)
-
- Lithography (*L. Ocola, D. Mancini*)
 - X-Ray Nanoprobe (*J. Maser, B. Stephenson*)

Complex oxides with new functionalities

Sub-wavelength photon confinement/propagation

Fabrication and Characterization Tools in CNM

FIB/SEM

State-of-the-art nanofabrication and characterization tools require highly engineered specialized environments:

- FIB/SEM
- E-beam lithography (25 kV, 100 kV systems)
- Confocal laser scanning Microscope
- SEM/Scanning probe microscopy

E-beam Lithography

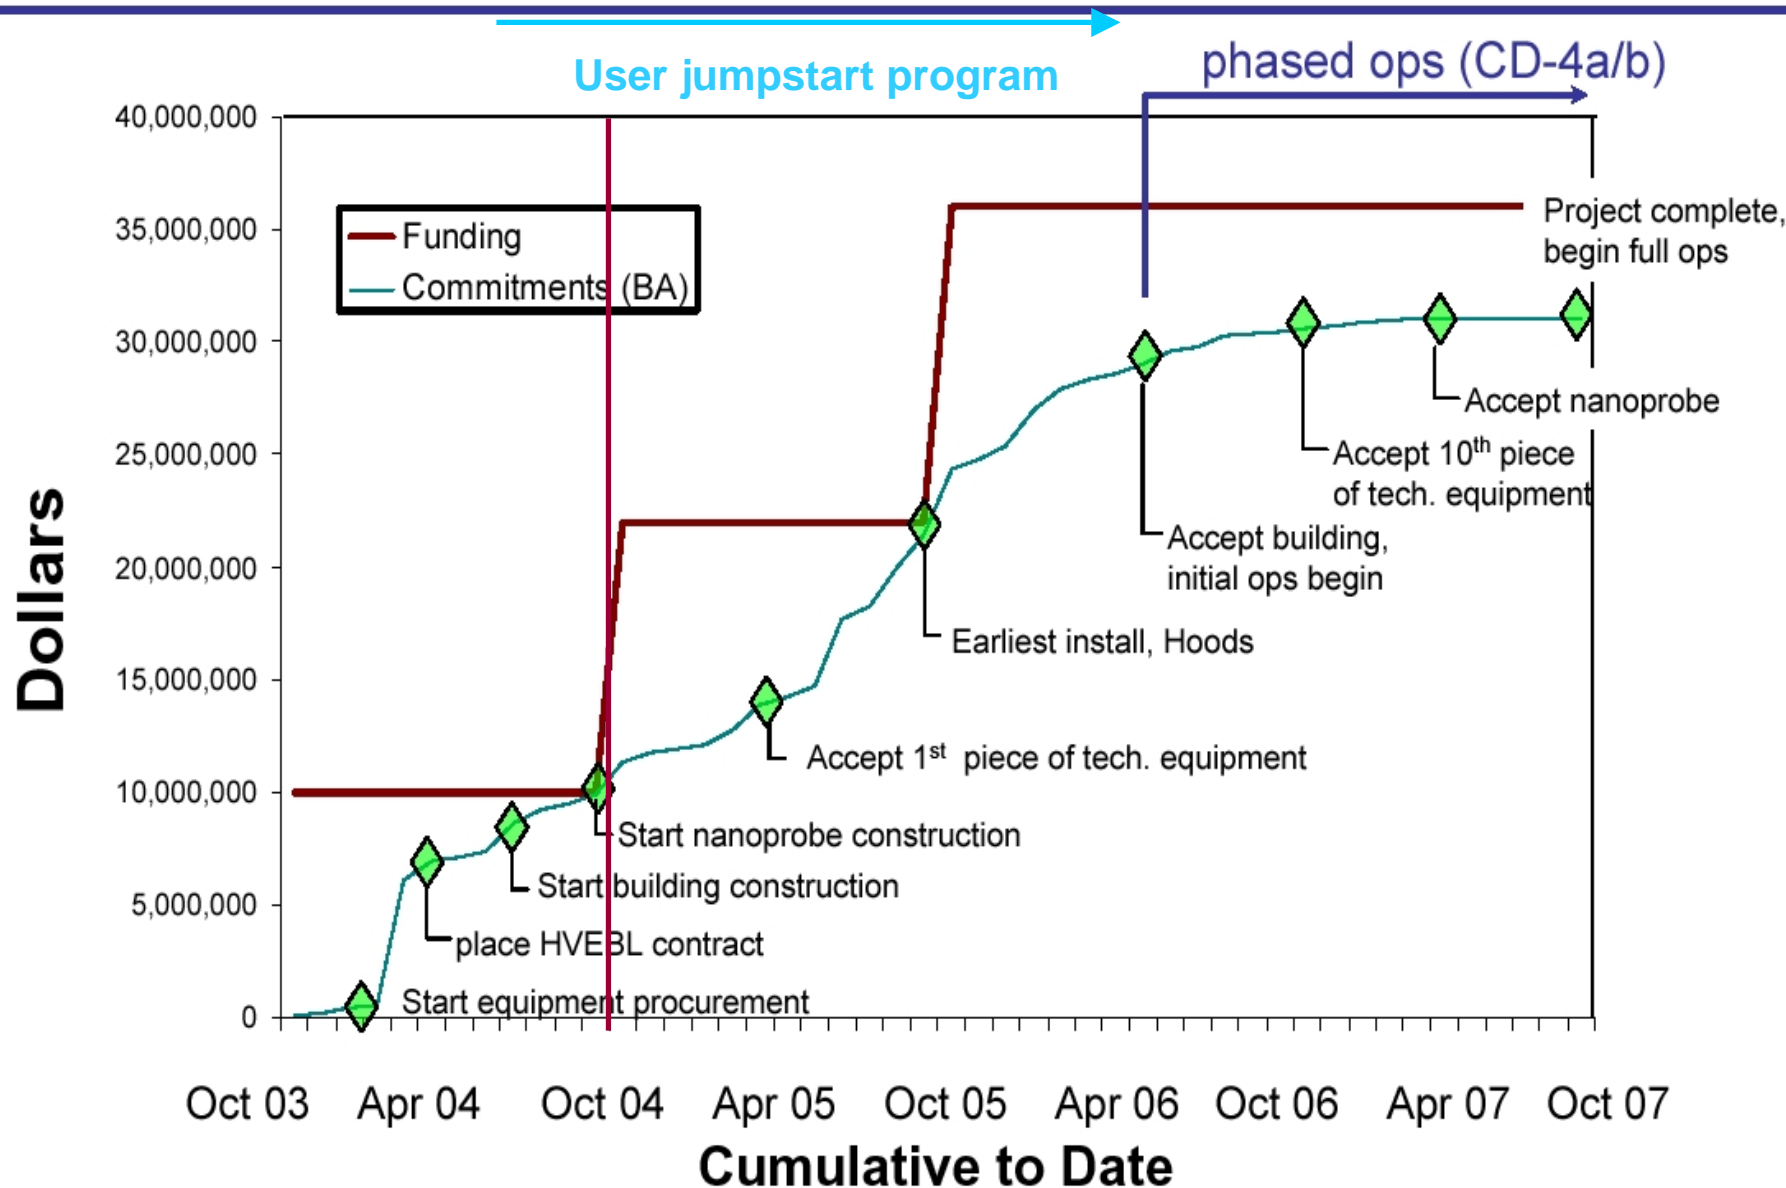

Confocal Laser Scanning
Microscopy

Combined
SEM/SPM

Equipment Cost/Schedule

Hard X-ray Nanoprobe

- Overall specifications:

- Energy range: 3 – 30 keV
 - Excitation of most elements
- Spatial resolution: $\delta = 30$ nm
 - Limited by x-ray optics.
- Tomographic transmission imaging.
- Full nano-spectroscopy capability
 - Near-edge spectroscopy.
- Diffraction-contrast Imaging

Why diffractive optics?

X-ray optics	Diffractive Optics	Mirror Optics	Refractive Optics
Numerical aperture	<ul style="list-style-type: none"> High NA possible (Limit: manufacture) 	– Limited NA (θ_c)	Limited NA (D_{eff}) Compton scattering
Efficiency	20% - 30% (60%)	70% - 90%	20% - 30%
Chromaticity	$f \sim 1/\lambda$	Non-chromatic	$f \sim 1/\lambda^2$
Field of view	Y ($\delta > 10 \text{ nm}$)	<ul style="list-style-type: none"> Kirkpatrick/Baez: N Wolter Y ($> 13\text{nm}$) 	Y
Other	<ul style="list-style-type: none"> Monochromatic beam On-axis geometry Any x-ray energy 	<ul style="list-style-type: none"> White (pink) beam Grazing incidence geometry. Any x-ray energy 	<ul style="list-style-type: none"> Monochromatic beam On-axis geometry Long lenses Limited energy range

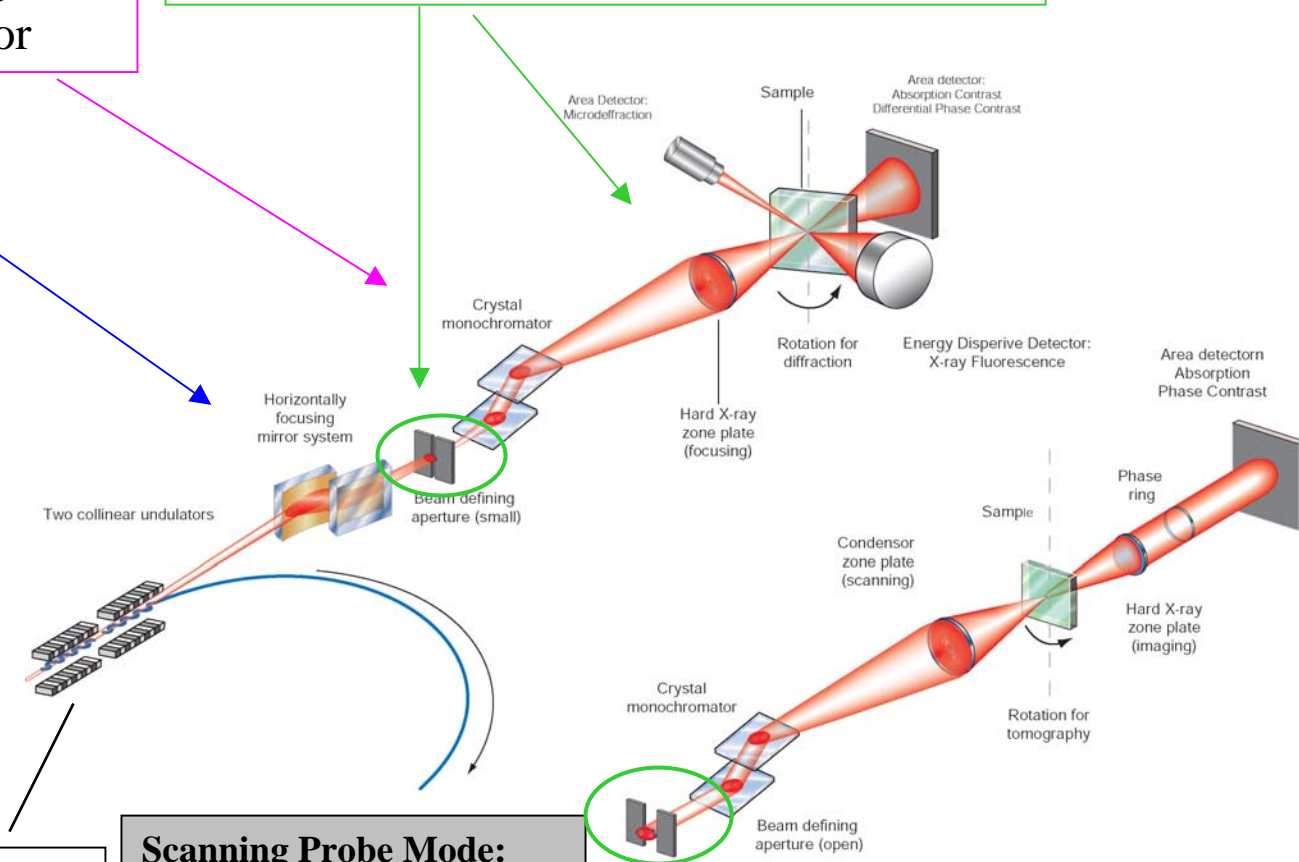

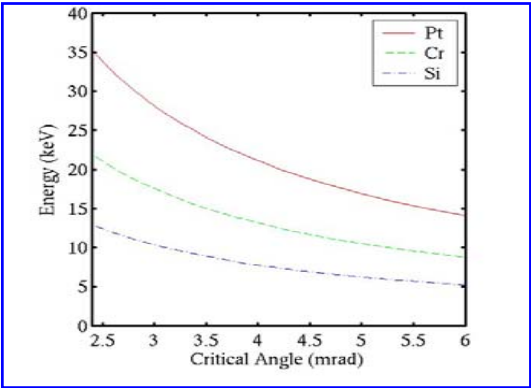

Diffractive optics allow sub-10 nm resolution (technical challenges)

Hard x-ray Nanoprobe beamline layout

LN₂ cooled crystal monochromator

Spatially coherent wavefront, BDA closed

Double mirror system:
 M1a: fully illuminated, elliptically bent
 M1b: flat

Twin undulators: $\lambda_u = 3.3$ cm
 10^{20} hv/s/mm/mrad/0.1% BW
 $> 10^{13}$ hv/s/ μm^2 (8 keV)

Scanning Probe Mode:
 BDA closed to provide coherent illumination of zone plate

Full-Field Transmission mode:
 BDA open to use full undulator flux

Nanoprobe BL status

- Radiation enclosures and standard components being installed on APS floor

- Shielding verification: Mar/05
- Major components (zone plates, mirror system, monochromators) being ordered
- Beamline components to be installed by Dec/06
- Nanoprobe instrument design ongoing; installation by Mar/07
- User jumpstart instrument being commissioned

Courtesy R. Winarski

25 First Steps: Hard x-ray nanoprobe instrument

- Requirements:
 - 4-5 nm mechanical resolution,
 - active vibration control
 - μ rad resolution for spectral scans

Hard X-ray Nanoprobe Prototype Instrument

- Approach:
 - Laser Doppler interferometer on reference frame measures *absolute* position of optics, sample.
 - SMALL-RANGE flexures + piezo-feedback respond to laser interferometer input
 - Fine scan x/y of zone plate

“User Startup” Instrument

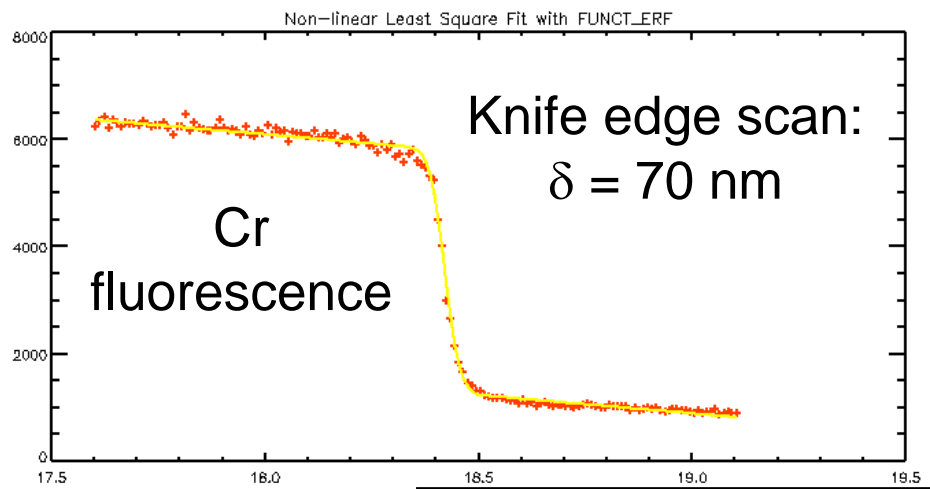

D. Shu, J. Maser, B. Lai, S.Vogt
Y. Han, C. Preissner, R.Winarksi,M. Holt

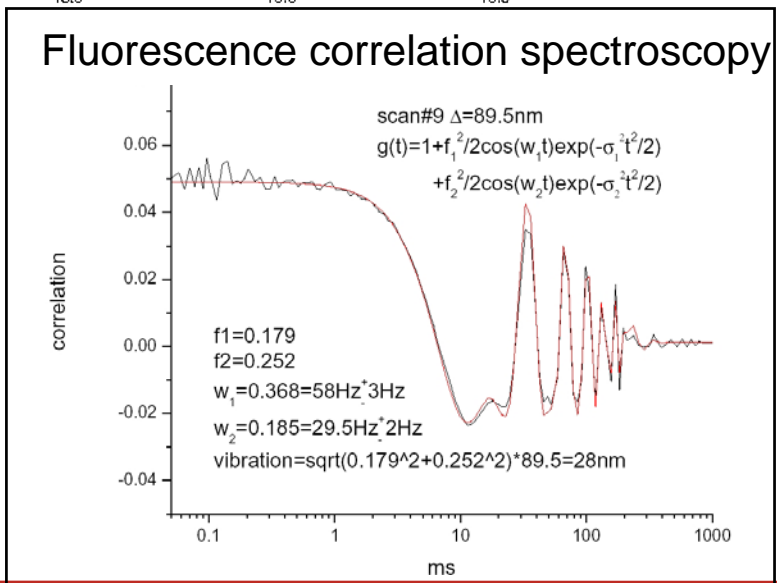

2D Zone plate flexure stage

First system characterization 8-ID-E

$Y(X) = A[0] + A[1] * \text{ERRORF}(Z) + A[4] * X$
 $Z = (X - A[2]) / A[3] / \text{SORT}(2)$
 FWHM = $2.355 * A[3]$ = 0.0673861
 A0 = 16122.1 SIGMA = 7.60474
 A1 = -2258.78 SIGMA = 0.188991
 A2 = 18.4204 SIGMA = $7.30013e-06$
 A3 = 0.0286141 SIGMA = $1.07577e-05$
 A4 = -682.710 SIGMA = 0.413540
 GOODNESS OF FIT = 84.2899

Fluorescence correlation spectroscopy analysis courtesy Yujie Wang

Aug/04:

ZP: $dr_N = 50 \text{ nm}$

Demagnified source:
 $d = 70 \text{ nm}$

Measured spot size:

80 (70) nm

Total system noise (including synchrotron and beamline):

28 nm

Conclusion

- **CNM project has begun construction**
 - Building construction under way
 - Long leadtime equipment (HVEBL system) ordered
 - Hard x-ray Nanoprobe beamline under construction at 26-ID
- Phase-in of CNM operation: summer, 2006
- Full operations CNM, Nanoprobe beamline: Fall 2007
- User startup program accepts proposals:

<http://nano.anl.gov>

The people involved

- **CNM project:**

Eric Isaacs, Derrick Mancini, Stephen Streiffer, L. Ocola, K. Hellman

- **Nanoprobe beamline project**

- Brian Stephenson, J. Maser, Bob Winarski, M. Holt, Christa Benson, B. Tieman.

- **Instrument development:**

- Deming Shu, B. Lai, S. Vogt, Curt Preissner, Yufeng Han, Alex Smolyanitskiy.

- **Many others:**

- G. Schneider, A. Khounsary, Y. Li, L. Assoufid, M. Ramanathan, Y. Jaski, B. Brajuskovic, E. Rossi.
- Bill Wesolowski, Kevin Randall, Gary Edgell, Steve Davey, Bruce Stockmeier, Tom Barsz, Jon Hawkins, Greg Markovich, Ann Boron
