

XSD-XST-BCDA Strategy Document

MISSION

The mission of the Beam line Controls and Data Acquisition (BCDA) group within XSD is to develop software and electronic hardware for synchrotron radiation beam lines that serves the common needs of APS researchers, and to implement that software for the APS beam lines. Our commitment, to maximize the measurement efficiency of the beam lines we serve, shapes the culture and character of our group and how we behave and make decisions. Through collaboration with APS researchers, we design, develop, deploy, and maintain control system software and hardware that capture and create economies of scale and keep the APS at the forefront of science.

VISION

The BCDA Group will work closely and collaboratively with other XST technical groups to build and maintain the control systems of current and future APS beamlines, in support of XSD priorities.

STRATEGY

The BCDA Group will continue direct support of control systems at XSD beam lines. EPICS is used to structure the design of the controls into a layered system, allowing specialized collaboration with instrument scientists and controls communities within the APS as well as at other DOE facilities and abroad. Priority is placed on developing capabilities that capture and create economies of scale aligned with the priorities of XSD and the APS.

Upgrades are considered as part of a continuing, incremental improvement process. The group relies on a standards-based approach, with a strong preference for open-source or commercial-off-the-shelf components where possible. The group also relies on an innovative R&D program to supply such components which are not otherwise available.

A fundamental component is the assignment of a BCDA staff member as liaison to each assigned XSD beam line. The liaison acts as primary controls support contact for the beam line and coordinates team efforts to resolve problems and extend capabilities of the control system. This same strategy will be used to develop the control systems for the APS-U beam lines.

Through career development activities such as continuing education, conference attendance, participation in international controls discussions, and cross-training, the group maintains its leadership in delivering control systems for APS beam lines.

FIVE-YEAR GOALS

- data acquisition scripting integrated with analysis pipelines
- make custom electronics a deliverable (much like custom software)
- expanded fly scanning capabilities

- support the beam line needs for nanometer metrology (data-acquisition and diagnostics)
- transition to a field-bus based principal IOC platform
- integrate EPICS v7 in beam line controls

GOALS FOR FY2019 AND FY2020

- continue operations support at all assigned beam lines
- area detectors: support new and upgrade existing support
- Continue development of BlueSky based experiments on beam lines
 - Non-diffractometer beam lines
 - Diffractometer beam lines
 - Develop APS-specific diffractometer geometries: psic, s2d2, sevend
- identify controls hardware for future (3th quarter of FY2019)
 - principal IOC platform
 - motion controls strategy & standards
 - replacement for multi-channel scaler
- APS-U:
 - Control system installation for R&D beam line
 - integrate RAVEN instrument controls into R&D beam line
 - planning control systems for feature beam lines
 - coordinated energy scanning with undulator, monochromator, and diffractometer
- Integrate EPICS v7 data structures into device support as appropriate

BCDA SWOT ANALYSIS

Strengths	Weaknesses
<ul style="list-style-type: none"> • Group members have strong technical skills and often share experience. • Group has a good working relationships with beam line staff. • Group in regular contact with global EPICS support base. • Reliance on standardized components (hardware, software, and plans). • Group staff are available and eager to solve beam line controls problems. 	<ul style="list-style-type: none"> • Some expertise vested with individuals. • R&D program lower priority than operations support. • Large installed base increases resistance to change. • Coordination with other support groups. • Controls roadmap for new deployment is out of date
Opportunities	Threats
<ul style="list-style-type: none"> • New beam lines: new technologies and ideas • XST team approach to coordinate complete design team. • APS scientists and user community brings new and interesting science. • Global controls community shows how to implement new technologies. 	<ul style="list-style-type: none"> • Competition for scarce resources. • Disconnect with APS-U efforts. • Some new technologies need deep knowledge & expertise. • Existing technologies could reach end of life. • Technological evolution. • Without hardware roadmap, facility will make non-standard decisions.
